

Nudge

Meet the Patient Journey Optimizer.

-
- Deep behavioral profile
 - Intervention learning, per goal
 - Clinical and HEDIS insight
 - Agentic action, no cold starts
 - A companion that feels human

AMALGAM

Patients don't fail for lack of information. They get lost.

Today's tools hand everyone the same printed directions. Nudge works like navigation: it knows where this person starts, and it reroutes at every barrier. Five capabilities make that possible, and each one compounds the last.

- 01 Deep behavioral profile**
A confidence-scored understanding of the person that any app or service can build on.
- 02 Intervention learning**
Per-goal design with a closed feedback loop. Learn what works for this person.
- 03 Clinical and behavioral insight**
Population intelligence that moves engagement, outcomes, and HEDIS measures.
- 04 Agentic action**
Agents that never start from zero. They remove barriers before the patient names them.
- 05 The human companion**
Reads people the way a person would. The reason patients keep showing up.

The profile is a platform, not a feature.

From ordinary conversation, Nudge builds a living profile across 15 dimensions of a person's life.

Some facts are stated. Many are carefully inferred.

15 DOMAINS, ONE MAP

Identity, family, work and money, health history, personality, values, life story, coping style, routines, goals, stressors, resources. A patient's job alone says something about their schedule, their stress, and their financial headroom.

EVERY FACT CARRIES A CONFIDENCE SCORE

The system never acts on more certainty than it has.

BUILT PROGRESSIVELY, AND ETHICALLY

Observe first, validate over time, hold contradictions, preserve agency. A map, never a script.

The profile is the asset. Every product built on top of it starts knowing the person, instead of asking again.

The full 360° profile: 15 domains, one person.

Each domain fills in as the conversation goes. Nothing is asked twice, and nothing is assumed without a score attached.

Personalization this deep is the difference between advice and change.

The whole profile shapes every move Nudge makes: communication style, values, coping patterns, life context.

Two members miss doses for three days. Same lapse, opposite moves.

values independence

analytical

bristles at being told

Nudge's move: shows her the 30-day trend and asks what she wants to do about it. Her plan, her call. It sticks because she chose it.

family is everything

responds to encouragement

stretched thin lately

Nudge's move: ties the routine to mornings with his grandkids, shrinks the ask to one step, and celebrates the first win out loud.

A checkup is coming. One member needs a script; the other needs company.

health-anxious

avoids phone calls

plans in writing

Nudge's move: drafts her question list the night before and preps a portal message, so nothing depends on a phone call.

social

runs on accountability

morning energy

Nudge's move: suggests bringing his daughter along and books the early slot he actually keeps.

Two moments, out of hundreds of signals at work.

Nudge learns what works for each person, goal by goal.

For each goal, say weight loss or medication adherence, Nudge designs an intervention, delivers it, and watches what happens.

Every intervention is an experiment with a result.

Designed, not generic

Interventions are built from evidence-based behavior-change techniques, chosen against this person's barriers and motivators. No tip sheets.

Every attempt teaches the system

The response feeds back into the profile, so the next attempt is smarter than the last. Reinforcement learning at the level of a single life.

Same goal, different routes

One patient responds to streaks and progress data. Another needs the plan anchored to a daily ritual. Over time Nudge builds a per-person record of what actually changes behavior, goal by goal.

Ground truth on why members engage, at population scale.

Every profile and every feedback loop produces something the health system has never had: the behavioral levers behind quality measures, visible and movable.

Agents that don't start from zero.

Acting before it's asked, because it already knows the person.

Every agent on the market wakes up with amnesia. You explain your situation, you supervise the result.

A GENERIC AGENT

starts at zero · ask, explain, supervise

A NUDGE AGENT

starts with the whole map · acts on day 1

The job: systematically removing barriers between a person, their health, and their care team.

-  **Refill**
timed to payday, before the gap opens
-  **Appointment**
booked, prepped, questions drafted
-  **Transport**
ride arranged for the visit that matters
-  **Care team**
sent the barrier pattern, not just a flag

Unprompted, and still welcome, because it already knows the person.

Connected to the member's real life, with their permission.

Personal agents already read your inbox and calendar. Healthcare agents don't. Nudge closes that gap.

Inference becomes fact

A work schedule inferred from chat is confirmed by the calendar. A refill gap guessed from behavior is verified by the pharmacy account.

Action on the member's behalf, with approval

Drafts the refill request, replies to the scheduling email, books the ride. The member taps approve, and nothing moves without that tap.

Standard for personal agents. Missing in healthcare.

Bringing connectors inside the care experience is the gap Nudge fills, and the profile makes every connected signal mean more.

Every connector is opt-in. Every action is approved by the member.

A companion that reads people the way a person would.

The interface to everything is a companion, built on frontier models like Claude, that hears what's under the words.

"I'm fine."

reads the flatness under a two-word answer

That was a quick "fine." Long day on the road?

"Yeah. Didn't eat till 4."

hears the real barrier, no lecture coming

That'll wreck anyone's numbers. Want to try the cooler idea tomorrow? You pack it tonight, I'll remind you at 6.

Warmth is what earns the next honest answer.

Warmth is the engine

People confide in what understands them. Confiding builds the profile, and the profile powers everything above. The companion isn't a wrapper around the system. It is what feeds it.

Real psychology, never clinical

Motivational interviewing, readiness-to-change assessment, the craft of great coaches, delivered like a friend who happens to know their condition.

Trust by design

Confidence-scored inference, no false certainty, crisis-safe protocols, and the person's agency preserved throughout.

One month turned Ray's diagnosis into a working routine.

Ray, 58, drives deliveries. “Just found out my sugars are high and I’m on the road all day.” One member, one condition. The same engine runs them all.

One month. No new app to learn, no forms, no case manager on the phone.

One engine. Any condition, any program.

The profile, the learning loop, and the companion are condition-agnostic. Deployed for type 2 diabetes today, and warm from day one for whatever comes next.

Every conversation makes the map better.

A companion people trust produces a deeper profile. A deeper profile designs better interventions. Better interventions produce outcome data and clinical insight. Insight makes the agents smarter and the companion more helpful, which earns more trust.

Anyone can ship a health chatbot. What can't be copied is what Nudge accumulates: **a per-person, per-goal record of what actually works**, plus a behavioral context layer that makes every future product, ours or a partner's, smarter on day one. That is the moat, and it deepens with every conversation.

Nudge doesn't hand patients directions. It travels with them, and reroutes.
